

Refrigerator Checklist:

It may be convenient having an extra refrigerator, but old, inefficient refrigerators can cost you well over \$10 a month in electricity. New refrigerators use up to 40% less energy compared to one built in the 1970's.

- Keep refrigerators and freezers out of direct sunlight.
- Set your refrigerator to 3°C (38°F) and your freezer to -18°C (0°F).
- Keeping the refrigerator full but not overloaded is an efficient use of electricity.
- Clean your refrigerator's coils (back) and air intake grill (below the doors) every 3 months.
